Abdominal radiology

- Findings
 - Abnormal and normal
 - Evaluation and description of abnormalities according to Roentgen signs
 - Interpretation /Impressions
 - Diagnosis
 - Differential diagnoses
- Location
Margins
Number
Opacity
Size
Shape

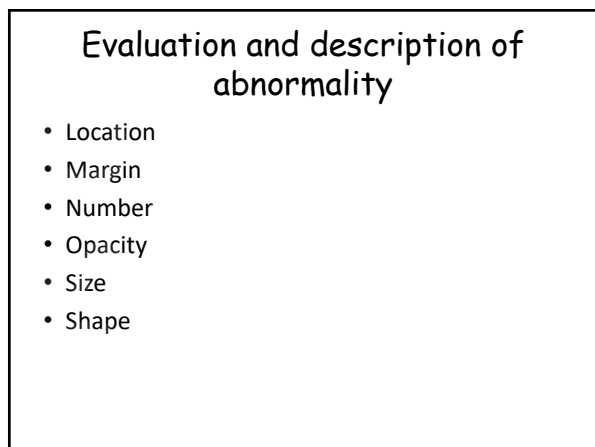

Common mistakes

- Mistaken normal as abnormal
- Inability to identify normal variation
- Inability to differentiate abnormal from normal
- Inability to interpret the abnormalities meaningfully
 - Good description is needed

Good quality radiographs

- Exposure technique
- Positioning
- At least 2 or more orthogonal views

8 YO SF American Cocker Spaniel was presented due to abdominal discomfort and a palpable abdominal mass

Transdiaphragmatic extension of retroperitoneal lipoma into intrathoracic extrapleural space through lumbocostal trigone (foramen of Bochdalek)

6 YO SF American DSH was presented due to a 2 days history of hematuria

Mineral opacity nodule – Nodular fat necrosis with mineralization, mostly in cats (Rates body)

Location

- Peritoneal cavity, retroperitoneal cavity, extra-abdominal
- Organ of origin

8 YO MN Mixed breed dog was presented with lumbar pain and right hind limb lameness

6 YO MN Canine Rat Terrier was presented with one history of vomiting and diarrhea. A firm mass was palpated at caudal abdomen.

Horizontal beam for detection of intra-peritoneal gas

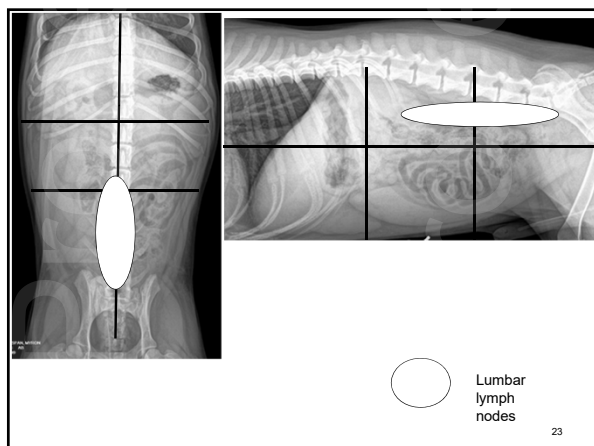

Left lateral recumbency

Left lateral horizontal beam

MASS

Identification of mass is by organ of origin, location and failure to identify a particular organ

Margins

- Irregular / nodular / rounded
- Size of liver and spleen: rounded margins
- Serosal margins: Well demarcated or ill defined

2 YO F American DSH was presented
due to suspected pregnancy

Number: systematic approach: Identifying of individual organs

- Organs not detected:
- Normal
 - Superimposition with other organs
 - Kidneys, urinary bladder
 - Lack of abdominal fat
- Abnormal
 - Peritoneal effusion
 - Superimposition with abnormal organs
 - Small size
 - Congenital anomaly: number of lumbar vertebrae

10 YO MC American DSH was presented due to a chronic history of ADR

Size: Liver

- Gastric axis
- Margin: Rounding
- Always clinical correlation

Liver: gastric axis

Size: Spleen

- Spleen:
Thickness is not reliable
- Margins: rounding

Size: Kidney on VD

Dog Cat
Length 2.5 – 3.5 2.5 – 3.0
Compare to the length of L2

Neutered cats 1.9 – 2.6

Variation in kidney size and shape

Size

SI diameter $\leq 1.5 \times$ Height of L5
Obstruction $\geq 2.4 \times$ Height of L5

Size

SI diameter $\leq 2 \times$ Height of
cranial end plate of L2
SI diameter ≤ 12 mm
Obstruction $\geq 2 \times$ Height of
cranial end plate of L2

Take home message

Careful examination of the
abnormalities will provide a list
of meaningful differential
diagnoses

Thank you
